MODULE 2 · CHATGPT

Integrated ChatGPT Tools

When to use web search, data analysis, image generation, canvas and voice, and how to check what each one returns

ChatGPT includes tools that expand what it can do: searching the web, analyzing files, generating images, editing documents side by side and talking with you. Each tool solves a different problem and fails in its own way. This guide explains when to activate each one and how to check what it produces.

6
integrated tools covered

3
questions before you activate a tool

1
golden rule: check the result

01 What each tool is for

Tool	Use it for	Check before you use it
Web search	Recent data, news, prices and official documents	Open the cited sources and confirm the date and author
Data analysis	Calculations and charts from spreadsheets and CSV files	Recompute a few rows by hand and compare
Image generation	Illustrations, mockups and concept visuals	Review text inside the image, logos and rights; an image is illustrative, not evidence
Canvas	Editing long documents or code together with you	Review each change before you accept it
Voice	Practicing, dictating and quick conversations	Confirm the transcript before sending important content
File reading	Summarizing PDFs, reports and presentations	Ask for page citations and open two of them

AVAILABILITY

Which tools you see depends on your plan and the model you select. Check your account before you plan a workflow around a tool.

02 Three questions before you activate a tool

1. **What do I need?** If the model already knows it or you can paste the text, you may not need a tool.

2 **Is the data safe to share?** Upload only what you would be comfortable seeing in a public document. Remove personal and confidential data first.

3 **How will I verify the result?** If you have no way to check the output, reconsider the tool or the task.

03 Verifying what each tool returns

Web search

Prefer primary sources such as official sites, papers and regulators over summaries of summaries.

Calculations

Recompute one row by hand. If it does not match, do not use the total.

Images

Check hands, text, logos and any real people or brands before you publish.

Files

Ask which page each claim comes from, then open that page and read it.

04 Combining tools in one workflow

The strongest results come from a clear sequence, with a check at each step. Example: analyzing monthly sales.

1 Upload the sales spreadsheet and ask for the monthly trend with data analysis.

2 Recompute one month by hand and confirm the figure matches.

3 Use web search to find market context, and keep the sources you will cite.

4 Use canvas to draft the report, keeping every number linked to the sheet.

5 Review the final text against the sources before you share it.

ACTIVATE ONLY WHAT YOU NEED

Fewer active tools mean fewer surprises. Turn on a tool for the task, and turn it off when the task is done.

TO WRAP UP

- [ ] I know which tool fits each task.
- [ ] I verify every figure before I use it.
- [ ] I do not share data I would not share publicly.
