MODULE 2 · CHATGPT

GPTs, Projects and Agents

When to use each one, how to design them, and how to test them before using them seriously

Content 2026

A GPT, a Project and an agent solve different problems. A **Project** keeps the context of one piece of work; a **GPT** keeps rules and knowledge for a repeated task; an **agent** carries out several steps under your supervision. This guide helps you choose and test each one.

3
tools compared

5
tests to evaluate a GPT

1
rule: you approve every step

01 Choosing between a Project, a GPT and an agent

Question	Use a Project	Use a GPT	Use an agent
What does it keep?	Instructions and files for one piece of work	Rules and knowledge for a repeated task	A multi-step plan
Who decides?	You, in each conversation	You, when you define the rules	You, approving each step
Example	Proposals for one client	A proposal advisor with your tone and prices	Comparing five suppliers and building a table

STATUS OF GPTS

OpenAI has announced it will retire custom GPTs on provisional dates. Before you build one, check in your account whether the feature is still available; if you already have a GPT, consider moving its instructions to a Project.

02 A well-built Project

A Project groups what repeats in a piece of work: instructions, files and conversations. That way you do not paste the same context every time.

1. Name it after the piece of work, not the general topic.
2. Write instructions: role, audience, tone, limits and what must always be checked.
3. Upload only the files you need and review what they contain.

4. Use one conversation per task inside the Project.

03 Testing a GPT before you share it

A GPT can look good in your first conversation and fail on a real case. Test these five cases.

Test	What the GPT should do
Normal case	Handle well the task it was designed for
Edge case	Ask for the missing information before answering
Out of scope	Say it cannot help and suggest whom to ask
Sensitive data	Neither ask for nor repeat personal or minors' data
Consistency	Keep the tone and rules throughout the conversation

04 The agent: several steps, your approval

The agent runs a sequence (search, compare, summarize, build a deliverable). Your role is to set the goal, fix the limits and approve each step before using the result.

> **COMMON MISTAKE**
>
> Approving the final result without checking the sources of the intermediate steps. An early error spreads through the whole deliverable.

05 Worked example: a proposal for a client

1. **Project:** create the client's Project with its instructions and brief.
2. **GPT:** if the proposal repeats, define an advisor with your tone, your templates and your pricing policy.
3. **Agent:** ask it to compare three industry references and build a table with sources.
4. **Verification:** open two sources from the table and adjust anything you cannot confirm.

TO WRAP UP

- [ ] I choose a Project, a GPT or an agent based on the question of the work.
- [ ] I test a GPT with five cases before using it.
- [ ] I approve each agent step and verify its sources.
